Why your AI content isn't landing

The 7-Point Human Test

AI has made competent content free.

That sounds like good news until you notice what it does to the value of competent content: it collapses it. When anyone can produce a clean, well-structured, perfectly reasonable post in ninety seconds, clean and reasonable stops being a differentiator.

What went **up** in value is everything a model cannot manufacture — a number from your own business, an opinion you would defend in a hostile room, a story with a detail nobody would invent, a judgment call you got wrong and can explain.

Drafting costs almost nothing now, which puts **nearly all of the remaining value in the edit**.

Here is the gate. Every piece, every time.

---

1. Is this actually true?

Every claim, number, name and story. If you cannot point at where it came from, it does not go in. Models invent clients, statistics and results with total confidence — this is a reputational risk, not a style problem.

2. Does this sound like me?

Would a client who knows you recognise the voice? Read it aloud. Any sentence you stumble over is a sentence a reader stumbles over.

3. Is there a specific insight here?

Not a summary of things people already agree with. Something you know that they do not.

4. Could another creator have written this?

If any competent competitor could have published it word for word, it is not yours yet. This is the question that kills the most drafts, and it should.

5. Does it contain unnecessary AI language?

The tell-list is overleaf. Run it.

6. Would my ideal customer care?

Not your peers. Not your friends. The specific person you want to hire you.

7. Would I personally publish this?

If the answer is no, it does not ship. Not "post it anyway, consistency matters." One piece you would not stand behind costs more trust than three weeks of silence.

The AI tell-list

Structural tells

- Openings that announce the topic before saying anything ("In today's fast-paced world...")
- Perfectly balanced three-item lists where reality is lumpy
- Every paragraph the same length
- A neat closing summary that repeats what you just read
- "But here's the thing" used as a transition to nothing
- The mirrored correction: "You don't have an X problem, you have a Y problem" · "It isn't A. It's B." — the most seductive one, and the fastest to spot
- Rhetorical question → immediate answer, on repeat

Language tells

delve · unlock · elevate · leverage · harness · navigate · landscape · realm · tapestry · game-changer · "the power of" · "in the world of" · "when it comes to" · "it's not just X, it's Y" · "let's dive in" · truly · incredibly · absolutely · remarkably

Substance tells — the expensive ones

- **Advice with no cost.** Real advice has a tradeoff. If nothing is given up, nothing is being claimed.
- **Claims with no owner.** "Studies show", "experts agree", "research suggests" — delete or source.
- **Numbers you did not produce.** Any statistic you cannot point at must go.
- **Universal applicability.** If it is true for every business in every industry, it is useful to none of them.
- **Invented specificity.** The model will happily produce "one of my clients" who never existed.

The four substitutions

De-slopping removes what is wrong. This adds what is missing.

REPLACE	WITH	EXAMPLE
A category	A named instance	"a client" → "a 12-person recruitment agency in Leeds"
An adjective	A number or observable fact	"significantly faster" → "from nine days to two"
A generic outcome	The moment it became obvious	"results improved" → "the third call that week opened with the same question"
A recommendation	The recommendation **plus its cost**	"niche down" → "niche down — you'll lose about a third of your inbound for two months"

Four substitutions is usually the entire difference between a post that reads like software and a post that reads like someone who has actually done this.

The uncomfortable part: most people fail this test not because their editing is weak, but because the AI never had enough context about them to produce anything specific in the first place. Fixing the edit is treating the symptom.

Fixing the *input* is the actual job — and that is a longer conversation.
